UE23CS320A– Project Phase – 1
End Semester Assessment

Project Title : ***A Deep Learning and Generative AI-Driven Diet Recommendation System for Personalized Chronic Disease Management.***

Project ID : **17**

Project Guide : **Dr. Saritha**

Project Team : **Vatsal Jain** : PES2UG23CS681
Vivek Tutika : PES2UG23CS707
Pranav Shetty : PES2UG23CS721
Sourabh S Hegde : PES2UG23CS929

Problem Statement

- Existing systems offer one-size-fits-all nutrition suggestions.
- No continuous feedback loop for real-time dietary updates.
- Lack of patient trust and engagement with AI-only recommendations.
- No safety layer if the patient deviates from the suggested plan.

Abstract and Scope

Develop a deep learning–based system that provides real-time personalized diet plans for chronic disease management.
Integrate Generative AI to dynamically adjust diets based on patient input.

Scope:

- Focus on T2DM, CKD, and Hypertension.
- Include options for food preferences (veg, vegan, general preferences etc.).
- Offer supervision flexibility – family/doctor optional.
- Include an interactive chatbot for guidance.

Suggestions from Phase 1

Suggestions:

- Not to use Synthetic Dataset.
- Trying to incorporate too many ideas or AI models may slow down the overall software functions.

Solutions:

- Temporary use of kaggle dataset to form the base.
- Narrow down to the best and most efficient AI models for both fast and accurate results.

Requirement Specification

1) Functional Requirements:

→ User meal logging with deviation detection (manual / assisted).
→ Real-time diet recalculation after deviation.
→ Disease-specific dietary enforcement (T2DM, CKD, Hypertension).
→ Generative AI–based adaptive meal suggestions.
→ Optional clinician/family supervision and alerting.
→ Interactive chatbot for dietary guidance.

2) Non-Functional Requirements:

→ Data privacy and anonymization.
→ Low-latency response for real-time recalculation.
→ High explainability for medical safety decisions.
→ Modular architecture for future dataset replacement.
→ Scalability to multi-disease patients.

Confirmed Datasets

1) Open Food Facts (India Subset)

- 50,000+ packaged food products available in India.
- Nutrition labels, allergens, additives, Nutri-Score.
- Open Database License (ODbL).
- Role in system:
  - → Processed and packaged food handling.
  - → Barcode-based food logging.
  - → Nutrient validation for real-world consumption.

2) Indian Food Composition Tables (IFCT) 2017 - ICMR-NIN

- 528 commonly consumed Indian food items.
- ~151 nutritional parameters per item.
- Macronutrients, micronutrients, vitamins, minerals.
- Region-specific Indian dietary representation.
- Role in system:
  - → Ground-truth nutrition reference.
  - → Medical constraint enforcement.
  - → Nutrient calculation for all meal plans.

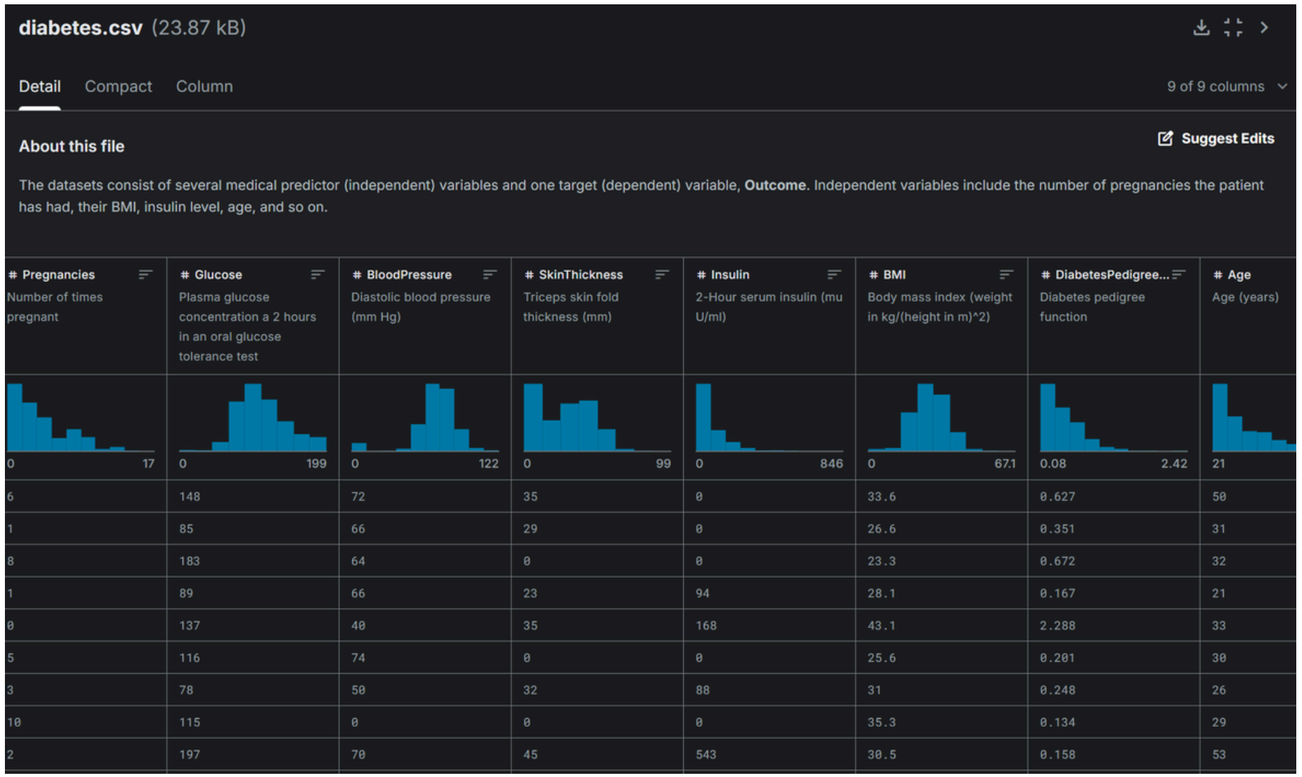
3) Indian Food Recipes Dataset – Mendeley Data

- ~6000 Indian dishes and recipes.
- Fields: ingredients, cooking method, region, diet type, nutrition estimates.
- Ensuring cultural and regional relevance in recommendations.
- Supporting diet-type filtering (veg / vegan / regional preferences).

Temporary Datasets

4) Kaggle Diabetes Datasets

- Files: diabetes.csv, diabetes_prediction_dataset.csv
- Features: glucose, BMI, age, insulin, HbA1c proxy, outcome.
- Usage:
  - → Initial risk classification models.
  - → Feature engineering validation.
- Limitation:
  - → No diet history.
  - → No longitudinal tracking.



diabetes.csv (23.87 kB)

Detail Compact Column 9 of 9 columns

About this file Suggest Edits

The datasets consist of several medical predictor (independent) variables and one target (dependent) variable, **Outcome**. Independent variables include the number of pregnancies the patient has had, their BMI, insulin level, age, and so on.

# Pregnancies Number of times pregnant	# Glucose Plasma glucose concentration a 2 hours in an oral glucose tolerance test	# BloodPressure Diastolic blood pressure (mm Hg)	# SkinThickness Triceps skin fold thickness (mm)	# Insulin 2-Hour serum insulin (mu U/ml)	# BMI Body mass index (weight in kg/(height in m)^2)	# DiabetesPedigree... Diabetes pedigree function	# Age Age (years)
0 – 17	0 – 199	0 – 122	0 – 99	0 – 846	0 – 67.1	0.08 – 2.42	21

Temporary Datasets

5) Kaggle Chronic Kidney Disease Dataset

- Files: kidney_disease.csv, kidney_disease_train.csv, kidney_disease_test.csv
- Features: creatinine, urea, sodium, potassium, hemoglobin.
- Usage:
  - → CKD risk and stage estimation.
  - → Constraint threshold validation.
- Limitation:
  - → Static snapshots.
  - → Synthetic imbalance and missing values.

Design Approach

Approach Followed:

- Layered modular architecture (Client–Backend–AI–Supervision).
- Hybrid AI + Clinical Rule-based safety model.

Why This Approach ?

- Pure AI lacks medical safety.
- Pure rule-based lacks personalization.
- Hybrid model ensures adaptability + safety.

Benefits:

- Modular & scalable.
- Real-time recalculation.
- High explainability.
- Model replacement flexibility.

Limitations:

- Higher system complexity.
- Integration overhead.
- Increased computational load during recalculation.

Design Constraints, Assumptions & Dependencies

Design Constraints:

- Strict medical safety enforcement (no unsafe meal outputs).
- Low-latency real-time recalculation.
- Use of verified nutrition datasets (IFCT, Open Food Facts).
- Limited availability of longitudinal patient data.

Assumptions:

- User logs meals honestly and consistently.
- If opted, the supervisor has good medical knowledge.
- Internet connectivity available for AI services.

Dependencies:

- Nutrition Knowledge Base (IFCT + Open Food Facts).
- Pre-trained Deep Learning models.
- Generative AI service availability.
- Secure backend infrastructure & database.
