UE23CS320A– Project Phase – 1
End Semester Assessment

Project Title : ***A Deep Learning and Generative AI-Driven Diet Recommendation System for Personalized Chronic Disease Management.***

Project ID : **17**

Project Guide : **Dr. Saritha**

Project Team : **Vatsal Jain** : PES2UG23CS681
Vivek Tutika : PES2UG23CS707
Pranav Shetty : PES2UG23CS721
Sourabh S Hegde : PES2UG23CS929

Problem Statement

- Existing systems offer one-size-fits-all nutrition suggestions.
- No continuous feedback loop for real-time dietary updates.
- Lack of patient trust and engagement with AI-only recommendations.
- No safety layer if the patient deviates from the suggested plan.

Abstract and Scope

Develop a deep learning–based system that provides real-time personalized diet plans for chronic disease management.
Integrate Generative AI to dynamically adjust diets based on patient input.

Scope:

- Focus on T2DM, CKD, and Hypertension.
- Include options for food preferences (veg, vegan, general preferences etc.).
- Offer supervision flexibility – family/doctor optional.
- Include an interactive chatbot for guidance.

Suggestions from Phase 2 - Review 1

Suggestions:

- User must not be asked to enter minute meal details. Needs to be more practical.
- Elaborate how the Risk Analysis module will be tackled.
- What hyperparameters should actually be defined?

Solutions:

- Users only log food items through search, barcode scan, or portion selection. Nutrients are computed automatically using verified nutrition datasets, and deviation detection is performed against the active diet plan.

- Clinical Risk Scoring Module: Aggregates user data, applies clinical guideline–based constraints (ADA, KDIGO, WHO), and uses ML models to compute disease-specific risk scores, combined into a final risk profile for alerts and diet adjustment.

Suggestions from Phase 2 - Review 1

Hyperparameters

Type Two Diabetes Mellitus (Random Forest Classifier)

- `n_estimators=120`
- `max_depth=4`
- `min_samples_leaf=125`
- `random_state=42`
- `n_jobs=-1`

Hypertension (Support Vector Classifier)

- `C=4`
- `kernel='rbf'`
- `probability=True`
- `random_state=42`

Chronic Kidney Disease (K-Nearest Neighbors Classifier)

- `n_neighbors=1`
- `weights='distance'`
- `algorithm='kd_tree'`

Suggestions from Phase 2 - Review 1

Requirement Specification

1) Functional Requirements:

→ User meal logging with deviation detection (manual / assisted).
→ Real-time diet recalculation after deviation.
→ Disease-specific dietary enforcement (T2DM, CKD, Hypertension).
→ Generative AI–based adaptive meal suggestions.
→ Optional clinician/family supervision and alerting.
→ Interactive chatbot for dietary guidance.

2) Non-Functional Requirements:

→ Data privacy and anonymization.
→ Low-latency response for real-time recalculation.
→ High explainability for medical safety decisions.
→ Modular architecture for future dataset replacement.
→ Scalability to multi-disease patients.

Confirmed Datasets

1) Open Food Facts (India Subset)

- 50,000+ packaged food products available in India.
- Nutrition labels, allergens, additives, Nutri-Score.
- Open Database License (ODbL).
- Role in system:
  - → Processed and packaged food handling.
  - → Barcode-based food logging.
  - → Nutrient validation for real-world consumption.

2) Indian Food Composition Tables (IFCT) 2017 - ICMR-NIN

- 528 commonly consumed Indian food items.
- ~151 nutritional parameters per item.
- Macronutrients, micronutrients, vitamins, minerals.
- Region-specific Indian dietary representation.
- Role in system:
  - → Ground-truth nutrition reference.
  - → Medical constraint enforcement.
  - → Nutrient calculation for all meal plans.

3) Indian Food Recipes Dataset – Mendeley Data

- ~6000 Indian dishes and recipes.
- Fields: ingredients, cooking method, region, diet type, nutrition estimates.
- Ensuring cultural and regional relevance in recommendations.
- Supporting diet-type filtering (veg / vegan / regional preferences).

Temporary Datasets

4) Kaggle Diabetes Datasets

- Files: diabetes.csv, diabetes_prediction_dataset.csv
- Features: glucose, BMI, age, insulin, HbA1c proxy, outcome.
- Usage:
  - → Initial risk classification models.
  - → Feature engineering validation.
- Limitation:
  - → No diet history.
  - → No longitudinal tracking.

About this file Suggest Edits

The datasets consist of several medical predictor (independent) variables and one target (dependent) variable, **Outcome**. Independent variables include the number of pregnancies the patient has had, their BMI, insulin level, age, and so on.

# Pregnancies Number of times pregnant	# Glucose Plasma glucose concentration a 2 hours in an oral glucose tolerance test	# BloodPressure Diastolic blood pressure (mm Hg)	# SkinThickness Triceps skin fold thickness (mm)	# Insulin 2-Hour serum insulin (mu U/ml)	# BMI Body mass index (weight in kg/(height in m)^2)	# DiabetesPedigree... Diabetes pedigree function	# Age Age (years)

Temporary Datasets

5) Kaggle Chronic Kidney Disease Dataset

- Files: kidney_disease.csv, kidney_disease_train.csv, kidney_disease_test.csv
- Features: creatinine, urea, sodium, potassium, hemoglobin.
- Usage:
  - → CKD risk and stage estimation.
  - → Constraint threshold validation.
- Limitation:
  - → Static snapshots.
  - → Synthetic imbalance and missing values.
